EGB-1P and EGB-2P
Governor/Actuator

Applications

The EGB-2P and EGB-1P are for use with Woodward electronic controls or similar systems where a backup ballhead governor is desirable.

Standard Features

The EGB-2P and EGB-1P are proportional electro-hydraulic actuators combined with isochronous or droop mechanical-hydraulic ballhead governors.

While proportional actuators can be used in the same type of service as other actuator models, they are particularly well suited to engines operating in tandem to drive a common load.

The EGB-1P is used in high-performance applications requiring fast-acting responses with lower work output. The EGB-1P has the same mounting pad, drive shaft, and terminal shaft configuration as the EGB-2P. Internal parts are also identical except for the EGB-1P’s smaller power piston.

The essential element of the actuator section is the electro-mechanical transducer. The transducer responds to the output from the electronic governor control and moves the pilot valve plunger. Pressurized oil is then directed to the actuator power piston to actuate the fuel or steam control. The pilot valve plunger movement on the actuator is balanced between transducer coil force and restoring spring force. On the governor, plunger movement is balanced between ballhead centrifugal force and speeder spring force. The pilot valve bushing is mechanically driven by the prime mover as an integral part of the governor drive shaft.

These EGBs are available with either a direct- or a reverse-acting actuator.

The direct-acting actuator operates with an electronic control which sends an increasing positive voltage to the actuator as fuel requirements increase. The terminal shaft of the direct-acting actuator will shut down the prime mover if the input voltage from the speed control is lost, thus providing a failsafe feature. However, ballhead governing will not start on its own. Operator intervention is required.

The reverse-acting actuator operates with electronic controls which send a decreasing positive voltage to the actuator as fuel requirements increase. The terminal shaft of the reverse-acting actuator goes to maximum fuel on loss of control voltage. The transfer from electrical actuator operation to ballhead governor operation takes place on its own. This is not meant to imply that an automatic operational transfer will take place (same speed setting, same load sharing capability—see Woodward Application Note 50507 for more information.)

The terminal shaft can be mounted on either or both sides of the case.

- Electrohydraulic actuator
- Mechanical-hydraulic governor
- Single or tandem operation
- Direct-acting or reverse-acting actuator output
The governor section has three operating adjustments. Once set, these adjustments usually do not require further adjustment.

- SPEED SETTING—either shaft or screw for external manual adjustment.
- SPEED DROOP—internally adjusted to permit parallel operation of units controlled by the centrifugal governor.
- NEEDLE VALVE—an external adjustment used to stabilize the centrifugal governor.

**Special Features**

Either a mechanical override or a pneumatic override device is available to provide a means of locking out the actuator pilot valve plunger. These devices are very useful for some start-ups, or if an electrical supply is temporarily unavailable or has failed.

The schematic diagram gives a simplified view of the oil passages to better illustrate the operation of the governor/actuator.

**Specifications**

### Output

- **Terminal Shaft**: 0.375 in. - 36 SAE serrations, or smooth with keyway, either side or both sides of case.
- **Work Capacity**: 1.6 J (1.2 ft-lb) through 32 degrees (EGB-1P)
- **Calibration**: 3.3 J (2.4 ft-lb) through 32 degrees (EGB-2P)
- **Linkage**: Recommended utilization angle of 21° for full load to no load. Relation between engine torque output and terminal shaft travel should be approximately linear.

### Governor/Actuator Drive

- **Shaft**: 0.562 in - 6 spline
- **Speed Range**: (1200 to 4000) rpm
- **Recommended Speed Range**: (2600 to 4000) rpm
- **Minimum Power**: 249 W (1/3 hp) to turn drive shaft at 3600 rpm normal operating speed and temperature
- **Rotation**: Clockwise or counterclockwise

### Control Characteristics

**Governor**

- **Steady State Speed Band**: ±0.25 % of rated speed
- **Droop**: Can be set from 0 % to 12 % over full output travel. Internal adjustment.
- **Ballhead Assemblies**: Solid or spring-driven vibration damping type. Available in un-damped natural frequencies of (0, 1.7, 3.0, 4.8, 6.7, or 9.2) Hz (C.P.S.)
- **Operating Temperature**: (–18 to +93) °C / (0 to +200) °F (with proper viscosity oil)

**Actuator**

- **Time Constant (Shaft Driven)**: EGB-1P: 48 ms (nominal) at 2400 kPa (350 psi) operating pressure
- **Hysteresis**: EGB-2P: 100 ms (nominal) at 2400 kPa (350 psi) operating pressure
- **Linearity**: Within 3 %
- **Within 0.5 %

### Transducer Coil

- **Coil Resistance**: 30 to 35 Ω at 20 °C (68 °F)
- **Maximum Allowable Current**: 200 mA during normal operation
- **Nominal Input Current Range**: (20 to 160) mA
- **Recessed Plug**: MS-3106A 12S-3S
Hydraulic System

Supply Oil: Hydrocarbon or synthetic oil. Synthetic oil only with special precautions (contact Woodward)

Source: Engine lubricating system or a separate sump

Supply Pressure: Minimum 10 inches water suction. Maximum 345 kPa (50 psi)

Operating Pressure: (2100 to 2400) kPa / (300 to 350) psi (plus supply oil pressure)

Filter: (20 to 25) µm for 7.6 L/min (2 gal[US]/min)

Viscosity: (100 to 300) SUS at normal operating temperature

Flow: EGB-1P—peak demand of 5.7 L/min (1.5 gal[US]/min) during transients; steady state flow 1.70 L/min (0.45 gal[US]/min) (nominal) at 2400 kPa (350 psi) and 60 SUS

EGB-2P—peak demand of 7.6 L/min (2.0 gal[US]/min) during transients; steady state flow 2.27 L/min (0.60 gal[US]/min) (nominal) at 2400 kPa (350 psi) and 60 SUS

Piping: 9.5 mm (3/8 inch) minimum

Construction

Case and Base: Cast-iron

Cover: Cast aluminum

Weight: (9 to 10) kg / (20 to 22) lb

Mounting

Configuration: Vertical (or horizontal with proper adjustments)

Studs: 5/16 inch (7.9 mm) diameter (4)
