DYNA 8000, 8200 & 8400 Series
Electronic Governor Systems

Installation and Operation Manual
Read this entire manual and all other publications pertaining to the work to be performed before installing, operating, or servicing this equipment.

Practice all plant and safety instructions and precautions.

Failure to follow instructions can cause personal injury and/or property damage.

This publication may have been revised or updated since this copy was produced. To verify that you have the latest revision, check manual 26311, Revision Status & Distribution Restrictions of Woodward Technical Publications, on the publications page of the Woodward website:

www.woodward.com/publications

The latest version of most publications is available on the publications page. If your publication is not there, please contact your customer service representative to get the latest copy.

Any unauthorized modifications to or use of this equipment outside its specified mechanical, electrical, or other operating limits may cause personal injury and/or property damage, including damage to the equipment. Any such unauthorized modifications: (i) constitute "misuse" and/or "negligence" within the meaning of the product warranty thereby excluding warranty coverage for any resulting damage, and (ii) invalidate product certifications or listings.

If the cover of this publication states "Translation of the Original Instructions" please note:

The original source of this publication may have been updated since this translation was made. Be sure to check manual 26311, Revision Status & Distribution Restrictions of Woodward Technical Publications, to verify whether this translation is up to date. Out-of-date translations are marked with . Always compare with the original for technical specifications and for proper and safe installation and operation procedures.

Revisions—Changes in this publication since the last revision are indicated by a black line alongside the text.

Woodward reserves the right to update any portion of this publication at any time. Information provided by Woodward is believed to be correct and reliable. However, no responsibility is assumed by Woodward unless otherwise expressly undertaken.

Warnings and Notices

Important Definitions
This is the safety alert symbol. It is used to alert you to potential personal injury hazards. Obey all safety messages that follow this symbol to avoid possible injury or death.

• **DANGER**—Indicates a hazardous situation which, if not avoided, will result in death or serious injury.
• **WARNING**—Indicates a hazardous situation which, if not avoided, could result in death or serious injury.
• **CAUTION**—Indicates a hazardous situation which, if not avoided, could result in minor or moderate injury.
• **NOTICE**—Indicates a hazard that could result in property damage only (including damage to the control).
• **IMPORTANT**—Designates an operating tip or maintenance suggestion.

---

**WARNING**  
Overspeed / Overtemperature / Overpressure
The engine, turbine, or other type of prime mover should be equipped with an overspeed shutdown device to protect against runaway or damage to the prime mover with possible personal injury, loss of life, or property damage.

The overspeed shutdown device must be totally independent of the prime mover control system. An overtemperature or overpressure shutdown device may also be needed for safety, as appropriate.

---

**WARNING**  
Personal Protective Equipment
The products described in this publication may present risks that could lead to personal injury, loss of life, or property damage. Always wear the appropriate personal protective equipment (PPE) for the job at hand. Equipment that should be considered includes but is not limited to:

• Eye Protection  
• Hearing Protection  
• Hard Hat  
• Gloves  
• Safety Boots  
• Respirator

Always read the proper Material Safety Data Sheet (MSDS) for any working fluid(s) and comply with recommended safety equipment.

---

**WARNING**  
Start-up
Be prepared to make an emergency shutdown when starting the engine, turbine, or other type of prime mover, to protect against runaway or overspeed with possible personal injury, loss of life, or property damage.

---

**WARNING**  
Automotive Applications
On- and off-highway Mobile Applications: Unless Woodward's control functions as the supervisory control, customer should install a system totally independent of the prime mover control system that monitors for supervisory control of engine (and takes appropriate action if supervisory control is lost) to protect against loss of engine control with possible personal injury, loss of life, or property damage.
To prevent damage to a control system that uses an alternator or battery-charging device, make sure the charging device is turned off before disconnecting the battery from the system.

Electrostatic Discharge Awareness

Electronic controls contain static-sensitive parts. Observe the following precautions to prevent damage to these parts:

- Discharge body static before handling the control (with power to the control turned off, contact a grounded surface and maintain contact while handling the control).
- Avoid all plastic, vinyl, and Styrofoam (except antistatic versions) around printed circuit boards.
- Do not touch the components or conductors on a printed circuit board with your hands or with conductive devices.

To prevent damage to electronic components caused by improper handling, read and observe the precautions in Woodward manual 82715, Guide for Handling and Protection of Electronic Controls, Printed Circuit Boards, and Modules.

Follow these precautions when working with or near the control.

1. Avoid the build-up of static electricity on your body by not wearing clothing made of synthetic materials. Wear cotton or cotton-blend materials as much as possible because these do not store static electric charges as much as synthetics.

2. Do not remove the printed circuit board (PCB) from the control cabinet unless absolutely necessary. If you must remove the PCB from the control cabinet, follow these precautions:
   - Do not touch any part of the PCB except the edges.
   - Do not touch the electrical conductors, the connectors, or the components with conductive devices or with your hands.
   - When replacing a PCB, keep the new PCB in the plastic antistatic protective bag it comes in until you are ready to install it. Immediately after removing the old PCB from the control cabinet, place it in the antistatic protective bag.
Chapter 1. General Information

Introduction

DYNA 8000, DYNA 8200, and DYNA 8400 governor systems provide engine governing for speed and power control of piston and gas turbine engines or steam and water turbines. The system components are a rotary actuator and an electronic controller, both of which are described further in this manual.

ACTUATOR
The actuator consists of an electromagnet with an iron armature rolling on the center shaft bearings. The actuator is provided with a return spring which balances the magnetic force of the armature. When DC current flows in the coil, the magnetic force moves the armature in the stator and this linear motion is transformed into rotary motion through a crank arm that forms part of the output shaft.

CONTROLLER
The electronic controller is the information processing unit of the governor assembly. It contains electronic components which process the input signal from the magnetic pickup to command the engine to the desired speed/RPM set into the controller. Electronic adjustments are available on the controller for field adjusting the unit as necessary.

DC POWER SOURCE
The governor system receives its power from a battery or an AC to DC power supply supplying 12 or 24 Vdc ± 20% to match the governor voltage. The average operating current consumption is 2.5A to 3.5A and the highest consumption is 14.75A during engine start-up or during a large load change. The power source must be rated above maximum stall current.

ISOCHRONOUS OPERATION
Isochronous operation is obtained by setting DROOP potentiometer fully counterclockwise. The DYNA governor is all electric, and it is normally operated in the isochronous mode; i.e., engine RPM is constant (± 0.25%) under steady state load conditions, up to the engine's maximum capability, regardless of load on the engine.

Figure 1. Isochronous Operation Mode
DROOP OPERATION
Droop operation is obtained by setting the DROOP potentiometer. Clockwise increases the droop. The amount of droop for a given setting depends on the magnetic pickup frequency and no-load to full-load actuator shaft rotation. A DROOP potentiometer setting of 10 o’clock will give about 4% droop, no load to full load when the pickup frequency is 4260 Hz and actuator shaft rotation is approximately 30° from no load to full load. Lower pickup frequency or smaller shaft rotation results in less droop for the system.

![Figure 2. Droop Operation Mode](image)

REMOTE SPEED ADJUSTMENT
An optional remote speed selector (DYNS-10000) is available for adjusting engine RPM from up to 90 meters (300 feet) from the engine. Refer to the electrical wiring schematic shown in Figure 6. The potentiometer can be connected for a narrow (fine) or wide speed range control.

Controller Selection Guide

Any of the controllers listed below can be used on a DYNA 8000, DYNA 8200, or DYNA 8400 actuator. The controllers are categorized as either Derivative Pot or Non-Derivative Pot models, depending on their adjustability features.

Controller Input Signal Frequency

Select your controller for the correct input signal frequency range generated by the magnetic pickup at the maximum engine operated (RPM) speed. Use the following formula to convert from RPM to Hertz.

\[
\left[\frac{\text{EngineRPM} \times \text{NumberOfTeeth}}{60s}\right] = \text{MpuHertz}
\]

Chapter 3.
Installation

The actuator of the governor assembly is mounted on the engine next to the fuel system. The magnetic pickup is normally mounted in the flywheel housing in such a way that it can count the teeth on the starter ring gear. The controller is off-mounted or installed in the engine control panel or cabinet.

1. Mount the actuator on a suitable rigid steel bracket or plate.

   Mounting kits are available for particular engines. Please contact your Woodward customer service representative if you require mounting information or a kit.

2. Set up the linkage and rod end bearings as shown in Figures 4 and 5.

3. Install the speed sensor (magnetic pickup) with SAE threads. (Magnetic pickups with M16x1.5 threads and 14.5 Ø mm tap drills are available.)

4. Remove the inspection cover over the ring gear teeth. (The magnetic pickup should not be installed in inspection covers.) Gear teeth should be free of burrs, excessive grease, or dirt.

5. Inspect the ring gear housing and pick a location where a 37/64" hole can be drilled such that the ring gear teeth will pass in front of the pickup pole face. After the 37/64" hole is drilled, use a 5/8-18 starting tap to cut threads for the magnetic pickup, and then run a bottom tap through the hole.

   The tapped hole should be drilled as perpendicular as possible over the center of the ring gear teeth.

6. Manually rotate the ring gear until a tooth face is directly in the center of the tapped hole. Gently turn the magnetic pickup clockwise into the hole until it bottoms on the tooth, and back off 1/4 turn. Tighten the jam nut firmly, maintaining the 1/4 turn position.

7. Mount the controller in the control panel.

8. Connect the wiring as shown in Figure 6 or according to your particular wiring diagram.
Figure 3. Installation of Magnetic Pickup

Figure 4. Rotary Actuator to Rotary Fuel Pump Linkage

Figure 5. Rotary Actuator to Linear Fuel Pump Linkage

DIAGRAM NOTES

1. Choose hole in actuator lever which causes actuator to rotate through its maximum rotation to provide minimum to maximum fuel.

2. Non-linear linkage to actuator is proper for best operation. Provides low GAIN at light loads and high GAIN at heavy loads.
Controller Dimensions & Wiring Diagram

Dimensions are in mm. Dimensions in brackets [ ] are in inches.

**DIAGRAM NOTES**

*Cable A:* DK44-XX 90° connector (specify length)  
*Cable B:* E26-22N (specify length)  
*Cable C:* DZ70-004-XX terminal strip (specify length) OR MS connector

* Shielded cable – Customer should purchase a cable with a wrapped Mylar supported aluminum foil shield with a drain wire.

** Remote speed potentiometer and 499K ohm resistor is P/N DYNS-10000.

† The 5K remote speed potentiometer can be wired two different ways:

1. As shown by the solid line from the wiper of the 5K potentiometer and then connected to terminal #9 (no resistor required). Adjustable range is approximately ± 5% at 1800 RPM.

2. As shown by the dashed line from the wiper of the 5K potentiometer through resistor R and then connected to terminal #8. Reducing the value of R increases the remote adjustable speed range.
The engine, turbine, or other type of prime mover should be equipped with an overspeed shutdown device to protect against runaway or damage to the prime mover with possible personal injury, loss of life, or property damage. The overspeed shutdown device must be totally independent of the prime mover control system. An overtemperature or overpressure shutdown device may also be needed for safety, as appropriate.
Actuator Dimensions

DYNA 8000 Series

Dimensions are in millimeters. Dimensions in brackets [] are inches.
DYNA 8200 Series

Dimensions are in millimeters. Dimensions in brackets [ ] are inches.

DYNA 8400 Series

Dimensions are in millimeters. Dimensions in brackets [ ] are inches.
Chapter 4.
Calibration

As mentioned previously, any of the controllers described in Chapter 2 can be used with DYNA 8000, DYNA 8200, or DYNA 8400 actuators. The controllers are categorized as either Derivative Pot or Non-derivative Pot models, depending on their adjustability features, and each category has its own calibration procedure. Follow the calibration instructions relevant to the controller type you have. Model numbers are provided to help you determine the correct calibration procedures to follow.

Switch SW1 and SW2 Adjustments

Switch adjustments are the same for both controller types. These switches allow for fuel response ranges (SW1 for matching either diesel or gas engine dynamics) and actuator selections (SW2 for either DYNA 8000, 8200, or 8400 actuators)

SW1 selects one of two integrating rate ranges. The diesel version integrates at twice the rate of the gas version
- Set S1 to the OFF position for diesel engine applications.
- Set S1 to the ON position for gas/gasoline engine applications.

NOTE: For some diesel engines, better operation may be obtained by placing SW1 in the ON position. If difficulty is experienced in the OFF position, try SW1 ON and recalibrate.

SW2 selects the point at which actuator coil current level causes the integrator limit to be actuated. This level is nominally 6.3A for the DYNA 8000 and 7.3A for the DYNA 8200 and 8400 actuators.

The easiest way to set the switches is to apply pressure with a small pointed object until the switch clicks into position.
Calibration Procedure for Non-Derivative Pot Controllers

Model Numbers:

8270-1021 (DYN1-10654-000-0-24)
8270-1004 (DYN1-10654-000-0-24)
8270-1072 (DYN1-10654-001-0-24) [CE Marked]
8270-1053 (DYN1-10654-704-0-12)

Connection Information

When using an ILS unit, the remote speed potentiometer may be left connected to the controller as shown.

When an ILS unit is used, connect 3-wire shielded cable to terminals 6, 7 and 8. Connect drain shield wire to terminal 10 at the controller only. The other end of drain shield wire is to be cut off and taped.

Calibration Procedures

1. Refer to Figure 6 or Figure 7 before making any adjustments of the potentiometers, DROOP, I, GAIN and SPEED.

2. Turn power OFF to be sure that the engine is not operating.

3. Initial potentiometer settings:
   a. Set the I adjustment three divisions from zero and the GAIN at the second division from zero.
   b. For isochronous operation, set DROOP counterclockwise to minimum position as shown in Figure 1.
   c. For DROOP operation, set DROOP potentiometer clockwise to obtain desired amount of DROOP from no-load to full load. Turning potentiometer clockwise increases DROOP.

   If the full 35° rotation of the actuator shaft is used and the linkage adjusted to use only the active fuel range, the maximum obtainable DROOP would be approximately 12% at full load.

4. Start the engine.

5. Adjust the controller speed potentiometer until the engine is operating at the desired engine RPM. Clockwise increases engine RPM.

6. If the governor system is unstable, slightly reduce the GAIN setting.
   NOTE: Except for the speed adjustment, the potentiometers have internal stops at the 0 and 100% positions.

7. With the engine unloaded, finalize the settings, I and GAIN adjustments as follows:
   a. Turn the GAIN adjustment clockwise slowly until the actuator lever oscillates. (You may need to disturb actuator lever to cause oscillation.) Reduce the GAIN adjustment slowly counterclockwise until the lever is stable. Upset the lever by
hand. If the lever oscillates 3 to 5 diminishing oscillations and stops, the setting is correct.

b If system performance to load changes is satisfactory, omit step (c).

c Reduce the GAIN setting counterclockwise one division. Next, turn the I adjustment fully clockwise while observing the actuator lever. If the lever does not become unstable, upset it by hand. When the lever slowly oscillates, turn the adjustment counterclockwise slowly until the lever is stable. Upset the lever again; it should oscillate 3 to 5 times and then become stable for optimum response.

**NOTE:** Use whichever settings from steps (b) or (c) provide the best performance.

8. The unit is now calibrated.

**Calibration Procedure for Derivative Pot Controllers**

**Model Numbers:**

8270-1024 (DYN1-10684-000-0-12)
8270-1073 (DYN1-10684-000-0-24)

**Calibration Procedures**

1. Observe that potentiometer settings are adjustable from zero to 100%. Each small division is 10%. The speed potentiometer is 10K, 20 turn.

2. Set SW1 and SW2.

   Set switch, S1, for the correct engine:
   - Set S1 to the OFF position for diesel engine applications.
   - Set S1 to the ON position for gas/gasoline engine applications.

   Set switch S2 for the correct actuator:
   - Set S2 to the "OFF" position for DYNA 8000 actuator
   - Set S2 to the "ON" position for DYNA 8200 or 8400 actuator.

3. If a remote speed potentiometer is used for narrow range, set to mid range.

4. Initial potentiometer settings:
   - GAIN: 20%
   - I: 20%
   - D: 30%
   - DROOP: Zero

5. For isochronous operation, set DROOP counterclockwise to minimum position as shown in Figures 2 and 3.

6. For droop operation, set DROOP potentiometer clockwise to obtain desired amount of droop from no-load to full load. Turning potentiometer clockwise increases droop.

7. Start engine (No Load)
8. Adjust the controller speed potentiometer for desired engine speed.

9. Adjust the GAIN potentiometer clockwise until the engine begins to hunt. (If the engine remains stable at 100% GAIN, physically disrupt the actuator linkage by hand.) With the engine hunting, turn the GAIN potentiometer counterclockwise until stable.

10. Repeat step 9 for the "D" setting.

11. Repeat step 9 for the "I" setting.

12. The unit is now calibrated.
   NOTE: After calibration, it may be necessary to readjust the speed.

13. Conduct the following test:
    With the engine operating at rated speed, turn the electric governor off. When engine speed slows to approximately half of rated speed, turn the electric governor back on. Observe the overshoot. If there is a small hunt at steady state, slightly turn the "I" potentiometer counterclockwise until stable. In some cases, 2 to 3 Hz overshoot may be acceptable.

   WARNING
   For gas engines, make certain that method used does not put gas in exhaust which might result in an explosion.

   If possible, operate the unit through various load ranges up to 100% to ensure stability.
Chapter 5.  
Diagnostics & Troubleshooting

SYMPTOM: GOVERNOR IS COMPLETELY DEAD AND ACTUATOR LEVER STAYS AT MINIMUM POSITION WHEN POWER IS APPLIED TO GOVERNOR

<table>
<thead>
<tr>
<th>Means of Detection</th>
<th>Corrective Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>Check battery voltage at terminals 1 and 2 on controller. Terminal 1 is positive.</td>
<td>Check battery connections and contacts for turning power ON to the controller.</td>
</tr>
<tr>
<td>Check for proper linkage setup.</td>
<td>Correct and free linkage.</td>
</tr>
<tr>
<td>Magnetic pickup signal absent or too low. Measure AC voltage across terminals 10 and 11 while cranking the engine. Voltage should be min. 2.5 VAC. <strong>Note</strong>: The voltmeter should have an impedance of 5000 ohms/volts or higher.</td>
<td>Check pole tip gap over gear tooth. Gap should be .037 mm ± 0.127 mm (0.015&quot; ± 0.005&quot;).</td>
</tr>
<tr>
<td>Measure the resistance of the magnetic pickup coil. This should be above 150 ohms (250 ohms max).</td>
<td>If there is an open or shorted coil, replace the magnetic pickup.</td>
</tr>
<tr>
<td>Measure the resistance of each pin to the metal case of the magnetic pickup. No continuity should be evident.</td>
<td>If there is continuity to case, replace the magnetic pickup.</td>
</tr>
<tr>
<td>DC SUPPLY OFF. Place an insulated jumper between terminals 2 and 3 (TP1 &amp; TP2). With DC ON, the actuator should go to full stroke. DC voltage at terminals 4 and 5 should be within 3 volts of the supply.</td>
<td>If the actuator still does not move to full stroke, continue with steps below.</td>

Chapter 6. 
Product Support and Service Options

Product Support Options

If you are experiencing problems with the installation, or unsatisfactory performance of a Woodward product, the following options are available:

1. Consult the troubleshooting guide in the manual.
2. Contact the OE Manufacturer or Packager of your system.
3. Contact the Woodward Business Partner serving your area.
4. Contact Woodward technical assistance via email (EngineHelpDesk@Woodward.com) with detailed information on the product, application, and symptoms. Your email will be forwarded to an appropriate expert on the product and application to respond by telephone or return email.
5. If the issue cannot be resolved, you can select a further course of action to pursue based on the available services listed in this chapter.

OEM or Packager Support: Many Woodward controls and control devices are installed into the equipment system and programmed by an Original Equipment Manufacturer (OEM) or Equipment Packager at their factory. In some cases, the programming is password-protected by the OEM or packager, and they are the best source for product service and support. Warranty service for Woodward products shipped with an equipment system should also be handled through the OEM or Packager. Please review your equipment system documentation for details.

Woodward Business Partner Support: Woodward works with and supports a global network of independent business partners whose mission is to serve the users of Woodward controls, as described here:

- A Full-Service Distributor has the primary responsibility for sales, service, system integration solutions, technical desk support, and aftermarket marketing of standard Woodward products within a specific geographic area and market segment.
- An Authorized Independent Service Facility (AISF) provides authorized service that includes repairs, repair parts, and warranty service on Woodward’s behalf. Service (not new unit sales) is an AISF’s primary mission.
- A Recognized Engine Retrofitter (RER) is an independent company that does retrofits and upgrades on reciprocating gas engines and dual-fuel conversions, and can provide the full line of Woodward systems and components for the retrofits and overhauls, emission compliance upgrades, long term service contracts, emergency repairs, etc.

A current list of Woodward Business Partners is available at www.woodward.com/directory.

Product Service Options

Depending on the type of product, the following options for servicing Woodward products may be available through your local Full-Service Distributor or the OEM or Packager of the equipment system.

- Replacement/Exchange (24-hour service)
- Flat Rate Repair
- Flat Rate Remanufacture
Replacement/Exchange: Replacement/Exchange is a premium program designed for the user who is in need of immediate service. It allows you to request and receive a like-new replacement unit in minimum time (usually within 24 hours of the request), providing a suitable unit is available at the time of the request, thereby minimizing costly downtime.

This option allows you to call your Full-Service Distributor in the event of an unexpected outage, or in advance of a scheduled outage, to request a replacement control unit. If the unit is available at the time of the call, it can usually be shipped out within 24 hours. You replace your field control unit with the like-new replacement and return the field unit to the Full-Service Distributor.

Flat Rate Repair: Flat Rate Repair is available for many of the standard mechanical products and some of the electronic products in the field. This program offers you repair service for your products with the advantage of knowing in advance what the cost will be.

Flat Rate Remanufacture: Flat Rate Remanufacture is very similar to the Flat Rate Repair option, with the exception that the unit will be returned to you in “like-new” condition. This option is applicable to mechanical products only.

Returning Equipment for Repair

If a control (or any part of an electronic control) is to be returned for repair, please contact your Full-Service Distributor in advance to obtain Return Authorization and shipping instructions.

When shipping the item(s), attach a tag with the following information:
- return number;
- name and location where the control is installed;
- name and phone number of contact person;
- complete Woodward part number(s) and serial number(s);
- description of the problem;
- instructions describing the desired type of repair.

Packing a Control

Use the following materials when returning a complete control:
- protective caps on any connectors;
- antistatic protective bags on all electronic modules;
- packing materials that will not damage the surface of the unit;
- at least 100 mm (4 inches) of tightly packed, industry-approved packing material;
- a packing carton with double walls;
- a strong tape around the outside of the carton for increased strength.

To prevent damage to electronic components caused by improper handling, read and observe the precautions in Woodward manual 82715, Guide for Handling and Protection of Electronic Controls, Printed Circuit Boards, and Modules.

Replacement Parts

When ordering replacement parts for controls, include the following information:
- the part number(s) (XXXX-XXXX) that is on the enclosure nameplate;
- the unit serial number, which is also on the nameplate.
Engineering Services

Woodward’s Full-Service Distributors offer various Engineering Services for our products. For these services, you can contact the Distributor by telephone or by email.

- Technical Support
- Product Training
- Field Service

Technical Support is available from your equipment system supplier, your local Full-Service Distributor, or from many of Woodward’s worldwide locations, depending upon the product and application. This service can assist you with technical questions or problem solving during the normal business hours of the Woodward location you contact.

Product Training is available as standard classes at many Distributor locations. Customized classes are also available, which can be tailored to your needs and held at one of our Distributor locations or at your site. This training, conducted by experienced personnel, will assure that you will be able to maintain system reliability and availability.

Field Service engineering on-site support is available, depending on the product and location, from one of our Full-Service Distributors. The field engineers are experienced both on Woodward products as well as on much of the non-Woodward equipment with which our products interface.

For information on these services, please contact one of the Full-Service Distributors listed at [www.woodward.com/directory](http://www.woodward.com/directory).

Contacting Woodward’s Support Organization

For the name of your nearest Woodward Full-Service Distributor or service facility, please consult our worldwide directory published at [www.woodward.com/directory](http://www.woodward.com/directory).

You can also contact the Woodward Customer Service Department at one of the following Woodward facilities to obtain the address and phone number of the nearest facility at which you can obtain information and service.

Technical Assistance

If you need to contact technical assistance, you will need to provide the following information. Please write it down here before contacting the Engine OEM, the Packager, a Woodward Business Partner, or the Woodward factory:

**General**
- Your Name
- Site Location
- Phone Number
- Fax Number

**Prime Mover Information**
- Manufacturer
- Engine Model Number
- Number of Cylinders
- Type of Fuel (gas, gaseous, diesel, dual-fuel, etc.)
- Power Output Rating
- Application (power generation, marine, etc.)

**Control/Governor Information**

**Control/Governor #1**
- Woodward Part Number & Rev. Letter
- Control Description or Governor Type
- Serial Number

**Control/Governor #2**
- Woodward Part Number & Rev. Letter
- Control Description or Governor Type
- Serial Number

**Control/Governor #3**
- Woodward Part Number & Rev. Letter
- Control Description or Governor Type
- Serial Number

**Symptoms**
- Description

*If you have an electronic or programmable control, please have the adjustment setting positions or the menu settings written down and with you at the time of the call.*
